

THE SEISMIC BREAKAWAY HANGER

The ability to allow movement in all directions is key to seismic protection. The difficult part is being able to provide a hanger long enough to allow this extreme flexibility.

Metraflex has the perfect solution. Most pipes are run as tight to the ceiling as possible. The hanger will simply pull apart, allowing the full rated movement of the Loop. After an earthquake, the Loop is pushed back into position, the hanger pin is re-inserted and ready if needed in the future. Find out more by contacting your local sales rep today.

Multiple Breakaway Hangers are ideal for supporting long return bends on nested loops.

A cable tether is available for weight and flexibility support in large seismic loops.

Units can also be used with saddles to prevent long flexible legs on large loops from sagging.
